Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

ATTENTION: Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

IMPORTANT Identifies information that is critical for successful application and understanding of the product.

These labels may also be on or inside the equipment to provide specific precautions.

SHOCK HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

BURN HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

ARC FLASH HAZARD: Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

Product Overview

Allen-Bradley® line reactors help keep equipment running longer by absorbing many of the power line disturbances that can shut down your drive. Allen-Bradley isolation transformers can provide both voltage change and isolation for your variable speed drive. These designs are harmonic compensated and insulated gate bi-polar transistor (IGBT) protected to help assure optimum performance in the presence of harmonics.

IMPORTANT This publication covers several series of products. Verify your series letter before you begin.

Storage Guidelines

1321 Line Reactor products that are not installed and energized immediately should follow the storage guidelines. Following these guidelines will help reduce the appearance of oxidation from forming on the laminate surface and edges.

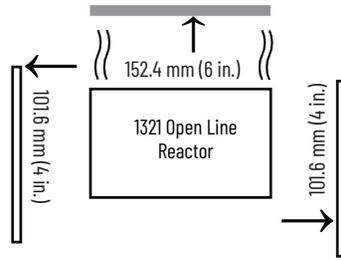

- Do not remove the protective packaging.
- Do not store the product outdoors or in an unprotected area.
- Do not store the product in an area where it is exposed to a corrosive atmosphere.
- Do not store the product where condensation could occur.
- Store the product in a climate-controlled building with adequate air circulation.
- Store the product in a clean, dust free, and dry atmosphere.
- Maintain a relative humidity level of less than 60% non-condensing.
- Limit rate of relative humidity change to less than 10% per hour.
- Store products on a vapor barrier membrane to help prevent water vapor migration.

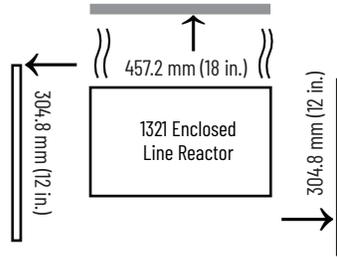

ATTENTION: The presence of oxidation does not indicate performance issues.

Mounting Clearance

The ventilation clearance on open line reactors must have a minimum of 101.6 mm (4 in.) from all surfaces, such as walls and other equipment. The figure that follows shows the minimum mounting clearance.

For the enclosed version of the line reactor, the ventilation clearance must have a minimum of 304.8 mm (12 in.) from all surfaces, such as walls and other equipment. The figure that follows shows the minimum mounting clearances.

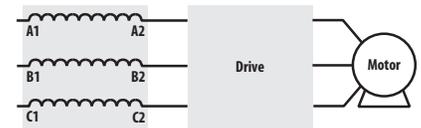

1321-3R, 1321-3RA, and 1321-3RB Series A, B, C Line Reactors

The diagrams that follow show how to apply the Allen-Bradley Line Reactors.

At the Input of the Drive

At the input of a drive, a line reactor helps protect against surges or spikes on the incoming power lines and help reduce harmonic distortion.

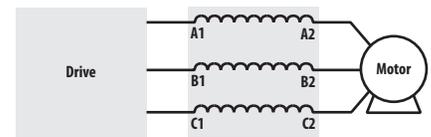

- Eliminate spurious tripping
- Improve true power factor
- Extend semiconductor life
- Reduce voltage notching
- Reduce harmonic distortion
- Meet IEEE-519 or EN-61800

At the Output of the Drive

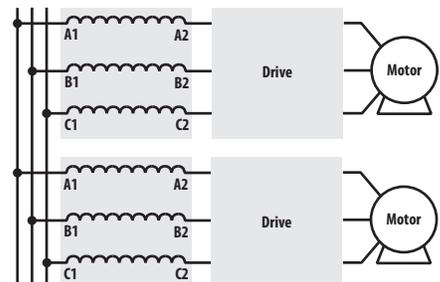

In long motor lead applications, Allen-Bradley load reactors that are located between the drive and motor help reduce dv/dt and motor terminal peak voltages. The use of a load reactor also helps protect the drive from surge currents that are caused by rapid changes in the load.

- Protect motors from long lead effects
- Reduce surge currents
- Reduce output voltage dv/dt
- Reduce motor temperature
- Extend semiconductor life
- Reduce audible motor noise

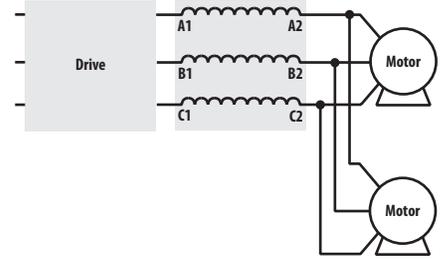

With Multiple Drives

Multiple drives on a common power line should each have their own line reactor. Individual line reactors provide filtering between each drive to help reduce any crosstalk while providing optimum surge protection for each drive.

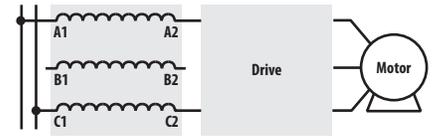

With Multiple Motors

When multiple motors are controlled by one drive, a line reactor can typically be used between the drive and all of the motors. Size the line reactor based on the total motor/load horsepower.

With Single-Phase Input

A three-phase reactor can be used for single-phase applications by routing each of the two input power conductors to the outside two coils and leaving the center coil disconnected. The sum of the inductance of the two coils is the total inductance that is applied to the circuit. Contact [Rockwell Automation Support](#) for assistance in specifying the proper reactor.

Selecting the Correct Impedance Rating

Knowing the proper level of impedance is important when selecting a line reactor because, line reactors protect your sensitive equipment from harmful line disturbances. Line reactors are designed to protect DC motor drives, AC variable frequency drives, and the motors they power. The information that follows provides guidance on understanding impedance selection, voltage spike protection, and motor protection.

Why is the Correct Impedance Rating Important?

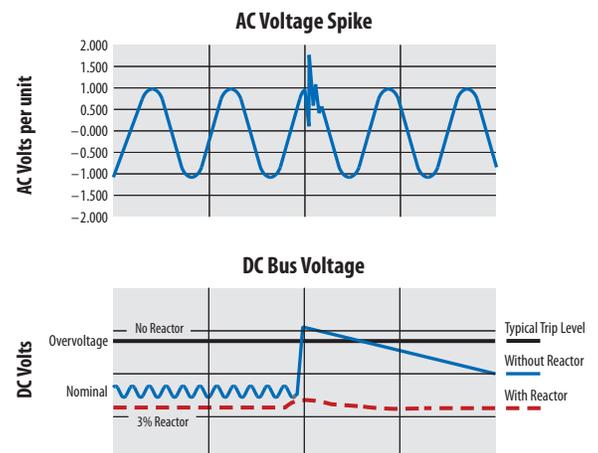

Selecting the correct impedance rating is critical for your job. An impedance value that is too low may not limit peak current. An impedance value that is too high may reduce input voltage. Allen-Bradley line reactors offer two impedance ratings.

- 3% Impedance Rated Reactors to Reduce Spurious Trips
 - Allen-Bradley line reactors that are rated at 3% are typically sufficient to absorb line spikes and motor current surges and will help prevent spurious tripping of drive and circuit breakers in most applications.
- 5% Impedance Rated Reactors to Reduce Harmonic Content
 - Allen-Bradley reactors that are rated at 5% are best for reducing harmonic current and frequencies. These line reactors help comply with IEEE-519 (not normally used as load reactors).

Voltage Spike Protection

Voltage spikes on AC power lines can cause elevation of the DC bus voltage, which may cause the drive to trip on an overvoltage condition.

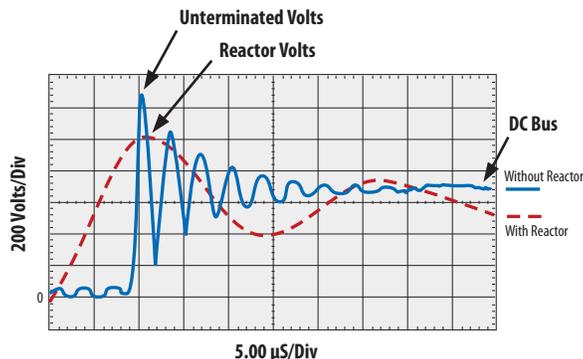

3% impedance reactors are effective at helping to protect drives against voltage spikes and spurious tripping. Allen-Bradley line reactors absorb these line spikes which help protect the drive from spurious tripping and damage.

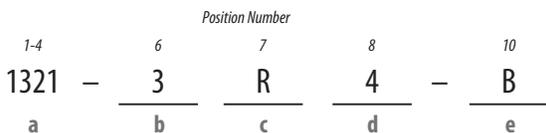

Motor Protection

Allen-Bradley load reactors can help protect motors from high peak voltages.

For IGBT drive applications with long drive-to-motor lead lengths, Allen-Bradley load reactors can help protect against fast dv/dt rise times.

(1) For 160 A rating, see the [Termination](#) section of this document for additional information.

(2) For applications with reactors rated 160 A or more with copper tab terminals, cable-style connections are recommended.

Termination

Reactors are supplied with either an integral-mounted terminal block, box lugs, or copper tabs which are front facing or side facing. See the tables that follow and the [Catalog Number Explanation](#) for specific information. The '3R' and '3RA' designations for the 1321 line reactors indicate the following: 3R = Open Enclosure Line Reactor and 3RA = NEMA 1 Enclosure Line Reactor. The dimensions and weights that are provided on the pages that follow are for estimating purposes only. Tab orientation may vary.

IP00/Open

Use the reactor outline shown to reference dimensions. This diagram is for reference only - your actual product may differ in terminal location and type, as well as the number and type of mounting options. Dimensions A, B, and C show the width, height, and depth, respectively. Dimensions D, E, and F show the mounting dimensions. Dimensions are for reference only and should not be used for manufacturing purposes.

Fundamental amps are used for sizing the reactor to be equal to or slightly higher than the total motor FLA. Sizing reactors to drive ampere ratings alone may result in mis-sizing the reactor.

- (1) Dimension C is measured at the widest point of the line reactor. This could be at the base or at the terminal depending on the catalog number. See [Termination on page 7](#) for examples of line reactor types.
- (2) Removable lifting rings are supplied with the unit.

1321 Reflective Wave Reduction (RWR) Series A Devices

Description of Reflected Wave Phenomenon:

The inverter section of a drive does not produce sinusoidal voltage, but rather a series of voltage pulses created from the DC bus, this is known as the reflective wave phenomenon. These pulses travel down the motor cables to the motor and then reflected back to the drive. The reflection is dependent on the rise time of the drive output voltage, cable characteristics, cable length, and motor impedance. If the voltage reflection is combined with another subsequent pulse, peak voltages can be at a destructive level. An IGBT drive output may have reflected wave transient voltage stresses of up to twice (2 pu or per unit) the DC bus voltage between its own output wires. Multiple drive output wires in a single conduit or wire tray further increase output wire voltage stress between multi-drive output wires that are touching. Drive #1 may have a (+) 2 pu stress while drive #2 may simultaneously have a (-) 2 pu stress.

For more details, see the Wiring and Grounding for Pulse Width Modulated (PWM) AC Drives, publication [DRIVES-IN001](#).

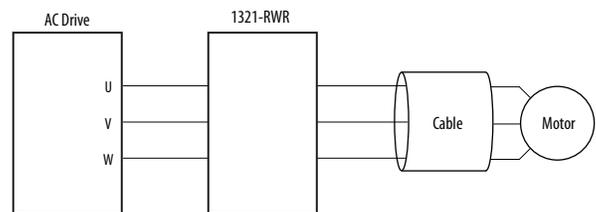

Applying RWR Devices

The diagrams that follow show how to apply the Allen-Bradley Line Reactors.

At the Output of the Drive

In long motor lead applications, an Allen-Bradley 1321 RWR located between the drive and motor helps to reduce dv/dt and motor terminal peak voltages. The use of an RWR device also helps protect the drive from surge currents that are caused by rapid changes in the load.

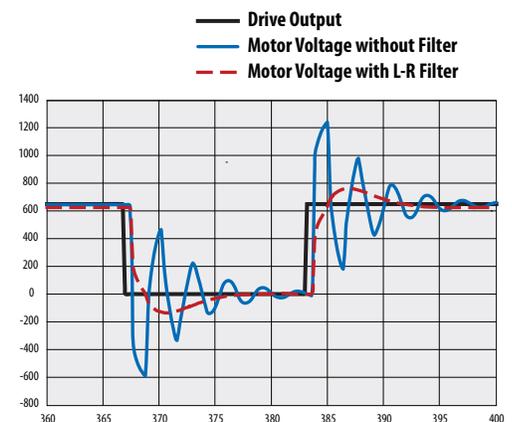

- Protect motors from long lead effects
- Reduce output voltage dv/dt
- Extend semiconductor life
- Reduce surge currents
- Reduce motor temperature
- Reduce audible motor noise

Motor Protection

Allen-Bradley RWR devices can help protect motors from high peak voltages.

For IGBT drive applications with long drive-to-motor lead lengths, Allen-Bradley RWR devices can help protect against fast dv/dt rise times.

Catalog Number Explanation

IMPORTANT 1321-RWR products replace existing 1204-RWR products. However, 1204-RWRC modules (RWR and Common Mode Choke assembly) are still available.

(1) For applications with RWR devices rated 200 A or more, cable-style connections are recommended.

Termination

Allen-Bradley 1321 RWR devices rated 45 amps (fundamental) and below are supplied with an integral mounted terminal block. Devices that are rated 55...160 amps (fundamental) are supplied with box lugs. Devices rated 200...400 amps (fundamental) can be supplied with box lugs or copper tabs. Above 400 amps (fundamental), solid copper tabs are used.

Mounting Dimensions and Weights

The dimensions and weights that are provided on the following page is for estimating purposes only. Contact your Rockwell Automation sales office if certified drawings are required for planning and installation.
